

# OHIO

## TOP 5 CROPS: OHIO

1. SOYBEANS
2. CORN
3. WHEAT
4. GRAPES
5. TOMATOES

### Crop Protection Leaders

Ohio is home to seven leading crop protection companies: AMVAC Chemical Corporation, BASF Corporation, Bayer CropScience, ISK Biosciences Corporation, Inc., Monsanto Company, Scotts Miracle-Gro Company, and Winfield Solutions, LLC. These companies provide thousands of jobs, boosting our economy and securing our state food supply.

- In the Buckeye State, an investment of \$1.00 in crop protection products yields anywhere from 14 to 20 times in direct economic returns, which the farming community can then reinvest to make Ohio's agricultural economy even stronger.
- The net benefits Ohio's agricultural economy gains from securing crops with various crop protection technologies ranges from \$86 to \$838 million, depending upon the product.

### CropLife America: Helping to Feed a Hungry World

*America's crop protection industry is helping to feed a hungry world, decrease food costs, drive our economy, and protect our environment.*

Crop protection technologies help control the thousands of weed species, harmful insects, and numerous plant diseases that afflict crops and threaten both the abundance and the safety of our food supply.

- The crop protection industry is one of the most highly-regulated in the U.S. today, ensuring the safety of users and consumers, and reducing environmental impacts. As the nation and the world confront the threat of climate change, the industry stands at the forefront of sustainable agriculture, helping farmers do more with less through innovation, while protecting the soil and natural habitats of the land they farm.
- Crop protection products help American farmers improve agricultural productivity, generating robust crop yields that drive local economies and create jobs from the farm, to the distribution system, to the grocery stores and restaurants who sell these plentiful foods. The strong crop yields made possible by crop protection also help keep food costs down so American families can afford meals for their table.

In Ohio, the crop protection industry brings these same commitments, values, and technologies to the state's **\$93 billion food and agricultural economy**, safeguarding the state's food supply and protecting its environment.

### Agriculture in Ohio: Driving the State Economy

*Agriculture generates 20% of Ohio's economy, employs 944,235 people, and ranks 17th in the nation for total agricultural cash receipts.*

**75,861  
FARMS**

75,861 farms cover 13,956,563 acres across our state, powering a diverse agricultural economy.

**\$7.1  
BILLION**

Ohio's agricultural products have an annual market value of \$7.1 billion, including 58% from crop production valued at \$4.1 billion.

**RANKS  
6TH**

The state's top crops are corn and soybeans which rank eighth and sixth, respectively for U.S. production.

**3RD  
LARGEST**

Ohio is the third largest producer of tomatoes in the U.S. and has the world's largest ketchup processing plant in Fremont, Ohio.

Without crop protection, the vital economic impact of Ohio's agricultural industry would be virtually devastated.

# CROP PROTECTION IN THE BUCKEYE STATE

## Ensuring Ohio's Robust and Healthy Food Supply

*The food supply nourishing Ohio families—and exported around the globe—is fundamentally reliant upon crop protection technologies.*

Every spring and summer, plant diseases reproduce in countless numbers, infecting – and ultimately killing – Ohio crops. Each year, **2.5 million weeds** prepare to emerge on every acre of Ohio's cropland, competing with crops for water, nutrients, space, and sunlight. And across Ohio, crop feeding insects reproduce in countless numbers, feeding on crops, reducing yields, making crops unmarketable, and in some cases killing the plant entirely.

These infestations threaten Ohio's food supply, economy, environment, and health of our citizens. Crop protection products stem those threats, preventing crop loss and protecting the agricultural base.

## Safeguarding Ohio's Environment and its Citizens

*Few industries play a greater role in driving sustainable agriculture than crop protection.*

Crop protection technologies enable Ohio farmers to manage weeds without plowing or tilling the soil, reducing erosion and avoiding runoff into rivers and streams, while also reducing fuel consumption. Nationwide, this practice saves **337 million gallons of tractor fuel annually**, and prevents **356 billion pounds of disturbed soil** from eroding into rivers and streams.

*In Ohio, crop protection technologies enable no-till production on 4,204,000 acres, preventing 10.1 billion pounds of soil erosion annually.*

Planting more acres of arable farmland decreases animal habitats, impacting biodiversity. Crop protection technologies enable Ohio farmers to do more with less, reducing the need to convert additional acreage for crops.

Many invasive weeds and nuisance plants grow back when mowed or pulled. Far from being a simple annoyance, weeds kill native plants, suffocate lakes, and plug reservoir intakes, destroying the natural habitats of fish, birds, and mammals. Crop protection products are indispensable weapons, enabling Ohio growers to successfully preserve several endangered species populations that had nearly vanished.

*Crop protection also guards the health of the food supply that sustains Ohio families and the world.*

The ever-increasing reach of the global economy has allowed infectious agents like salmonella and E. coli to enter our food supply. The U.S. commitment to crop protection technologies serves as a first line of defense, attacking these threats and generating a safe, healthy, and robust food supply for Ohio and the nation.

What would the Buckeye State's food supply look like **WITHOUT** crop protection?

## NO CORN

The delicious sweet taste of corn is a classic American summer experience, but without crop protection technologies over one-third of this crop for Ohio would be ravaged by aggressive weeds and vicious crop-attacking insects.

## NO SOYBEANS

It seems like every day a new study demonstrates the extraordinary health benefits of soybeans, and in fact, because of their variety of uses (oil, tofu, etc.) they are actually the second most valuable U.S. agricultural export. Without crop protection, imagine what a 40% reduction in Ohio's soybean crop would do to our agricultural export strength (not to mention the millions of vegetarians who rely on it for protein).

## NO GRAPES

From a children's juice box to a healthy office snack, the tangy sweetness of grapes would be virtually wiped out without the use of crop protection technologies, as the ruinous impact of plant diseases would virtually destroy Ohio's entire grape crop.
